

# Add a lasting punch to your soybean weed control program.

There are more broadleaf weed control problems in soybeans than any single herbicide can handle – even for a glyphosate. Fortunately, there are solutions: FirstRate\* and Python\* WDG herbicides.

## Apply FirstRate with a glyphosate for extended weed control.

An over-the-top application of FirstRate herbicide with Glyphomax\* Plus herbicide – or other glyphosate product – gives you these important benefits:

- Simple, one-pass control of common ragweed, morningglory, cocklebur, marestalk and sunflower.
- Application flexibility - FirstRate can be applied surface preplant, preplant incorporated or preemergence.
- Longer lasting weed control.
- Excellent crop safety - safe on soybeans with rotational freedom to most major crops, including corn, alfalfa, sorghum and wheat.

## Add residual control early with Python WDG.

An early season application of Python WDG herbicide lets you enjoy these special benefits:

- Residual control of pigweed, lambsquarters and velvetleaf – including triazine-resistant biotypes.
- Foundation control of waterhemp and black nightshade as part of a two-pass program.
- Tank-mix flexibility.
- Easy to manage low use rates.

Always read and follow label directions.
